Business Problem Statement

Transaction Intelligence & Revenue Leakage Detection | Zorvyn FinTech

Business Problem Statement

Zorvyn is a B2B FinTech platform serving 650 merchants across Logistics, Retail, EdTech, FMCG, Insurance, and E-Commerce, processing ₹30.89M in GMV across UPI, Credit Card, BNPL, Net Banking, NACH, Wallet, and Debit Card.

Despite this scale, the platform had no system to monitor transaction health, track merchant activity, or detect revenue loss. ₹1.57M was leaking through delayed settlements and chargebacks, 49 transactions failed with no breakdown of cause or recoverability, merchants were churning silently with no early-warning logic, and transaction, merchant, and settlement data all lived in silos with no unified view for leadership.

Project Deliverables

Built a star-schema MySQL database and wrote 11 SQL queries covering GMV trends, payment method performance, failure analysis, merchant churn classification, chargeback exposure, and business category benchmarking.

Delivered a 4-page Power BI dashboard covering Executive Summary, Merchant Health, Transaction Health, and Revenue & Settlement, with DAX measures for leakage detection, settlement lag, and churn scoring, giving leadership a single source of truth across all platform operations.
